🛍️ Advanced Retail Super Shop Management System (ARSSMS)

Language: ANSI C
Architecture: Structured Enterprise Console System
Storage: Binary File-Based Persistence
Version: 1.0

📌 Executive Summary

The Advanced Retail Super Shop Management System (ARSSMS) is a structured retail enterprise simulation platform developed entirely in ANSI C.

The system integrates core retail operations including:

• Secure administrator authentication
• Product inventory management
• Real-time stock control
• Sales transaction processing
• Revenue analytics
• Low stock monitoring
• Timestamp-based audit logging

ARSSMS models centralized retail workflow using deterministic structured programming and binary file-based persistence without dependency on external database systems.

🏗️ System Architecture

ARSSMS follows a layered logical architecture:

• Authentication Layer
• Product Inventory Management Module
• Sales Processing Engine
• Revenue Analytics Engine
• Audit Logging Layer
• Binary Persistence Layer

Although implemented within a single source file, functional responsibilities remain logically segmented.

🔐 Authentication Module

The system ensures secure administrative access.

Features:

• Automatic admin initialization on first execution
• Password hashing using djb2 algorithm
• No plaintext credential storage
• Binary verification against `retail_users.dat`

Default Credentials:

Username: admin
Password: admin123

Hashing Logic:

```
hash = ((hash << 5) + hash) + character
```

📦 Product Inventory Management Module

Each product record contains:

• Product ID
• Product Name
• Quantity
• Price
• Reorder Level

Functional Capabilities:

• Add product
• View product inventory
• Detect low stock condition

When quantity reaches or falls below reorder level, the system displays:

LOW STOCK

Storage File: `products.dat`

🛒 Sales Processing Engine

Each sale record contains:

• Sale ID
• Product ID
• Quantity
• Total Amount
• Timestamp

Operational Flow:

• Validate product existence
• Check stock availability
• Deduct quantity
• Compute total amount
• Record sale transaction
• Persist sale data

Revenue Formula:

```
Total Amount = Quantity × Price
```

The system prevents overselling by validating available stock before completing a sale.

Storage File: `sales.dat`

📊 Revenue Analytics Engine

The analytics module processes recorded sales transactions and computes:

• Mean (Average Sale Value)
• Variance
• Standard Deviation

Formulas Used:

```
Mean = Σ Sales / N
Variance = Σ (Sale − Mean)² / N
Standard Deviation = √Variance
```

Purpose:

• Evaluate sales performance distribution
• Measure revenue variability
• Analyze retail financial stability

📝 Audit Logging

All major system activities are recorded in:

`retail_logs.txt`

Logged Events:

• Admin login
• Product addition
• Sale processing
• Analytics execution
• System exit

Each log entry includes timestamp metadata for traceability.

💾 Data Storage Design

Binary files used:

File	Purpose
retail_users.dat	Authentication records
products.dat	Product inventory
sales.dat	Sales transactions
retail_logs.txt	Audit logs

Binary storage ensures:

• Efficient record alignment
• Faster read/write operations
• Reduced storage overhead
• Persistent retail data integrity

⚙️ Compilation & Execution

Compile:

```
gcc retail_management_system.c -o retail -lm
```

Run:

```
./retail
```

🧠 Engineering Highlights

• ANSI C structured programming
• File-based retail database simulation
• Real-time stock update logic
• Revenue computation integration
• Statistical sales analysis
• Deterministic memory management
• Timestamp-based operational traceability

🎯 Project Significance

ARSSMS demonstrates the capability to design and implement a centralized retail management system using low-level systems programming.

It reflects:

• Retail workflow modeling
• Structured data persistence
• Financial analytics integration
• Secure authentication handling
• Enterprise-grade inventory and sales logic

🏁 Conclusion

The Advanced Retail Super Shop Management System (ARSSMS) is a complete retail enterprise simulation platform implemented in pure ANSI C.

It integrates:

Authentication
Inventory Management
Sales Processing
Revenue Analytics
Audit Logging

All within a structured and deterministic runtime architecture.
